User Manual Addendum:

How to run the system on your local computer:

1. Start a Mongo server on your localhost, port 27017 – call it 'test'

2. Start a link generator instance by running the link-generator project (on port 8081 – already configured)

3. Start a social scout instance by running the social-scout-twitter project (on port 8080 – already configured)

4. The system is now ready to use. Making the following request will access the API and return a song matching a search string:

    > curl http://localhost:8081/returnLinks/{searchTerm}

5. Using a Twitter account, tweet a song and artists enclosed in music emojis (🎶) and with the Echoic flag included (#echoicmusic). This will trigger the social scout to respond to your tweet with a link to the song you wish.

Details for tracked link account, where all generated links can be seen as well as the number of times they have been clicked:

-   Website: www.tiny.cc

-   Username: thami

-   Password: yOMUVv132465798
